

Pit Stop Service Station

The potential responsible parties for this site sampled most of the potable wells within a one thousand foot radius down gradient of the site. A total of five potable wells were found to be above the state standards for gasoline related volatile organic compounds. These homes were provided with treatment systems or connected to city water. An additional round of sampling was conducted in May 2004 to determine if any additional homes in the area that still rely on private wells were contaminated. The results from the May 2004 sampling showed that the remaining wells in the area were safe for drinking water purposes.
